

What you don't know about swine flu

A logical paper on the h1n1 flu

Denny R Randall

5/3/2009

To start off with a little about me I am a logical thinking god fearing person. I have worked in many labs I went on to become a doctor however I could not finish do to the fact I can not tell another there love ones would ever die. I have had many heath problems over the years as well as many seizers so please forgive some of my writing skills.

A few years back I tried to start a company that would address issues in viral work and new ways to fight infections. In one paper I wrote it addressed how a super bug would mutate to its environment and deal with ways it would attack anti viral drugs.

The h1n1 has been doing everything it should be doing to become a strain we can not stop. In this paper I plan to out line everything I can and hope it will help someone the loss of one life is more then the world should ever deal with.

And the fear of knowing you may die from doing what you do everyday.

I may get in to some type of trouble for writing this as it can cause fear in its self.

Now on with what we know

Influenza A virus subtype H1N1, also known as **A(H1N1)**, is a subtype of [influenzavirus A](#) and the most common cause of [influenza](#) (flu) in humans.

The subtype contains human, swine and bird dna

We now know the subtype can cross to pigs the times of India a news paper had a head line a few days back
“H1N1 virus now spreading from humans to pigs”

Here is the link

<http://timesofindia.indiatimes.com/India/H1N1-virus-now-spreading-from-humans-to-pigs/articleshow/4479712.cms>

I bet it can and has moved to birds when a virus mutates and move from person to person to animals. This is a very bad sign most labs can't do this and if they can you don't know about them.

Also the virus is attracting young healthy people , people with strong immune systems in a normal time and world strong immune would be a great thing you could go on think nothing of it are think you have a cold.

At this time most of the usa is infected are becoming infected this would be the first wave as the call it, the 2nd would be stronger and more deadly as the 3rd

The anti viral drugs may give help and relief but at some point they may not help. In the past few years it has become hard for people with the answers to voice are work.

Now labs at the cdc are back logged the government has started to help as much as they say they can.

Fema has stocked piled what they call temporary casket's

Between the government and the public we will have to work hand in hand from stopping this ongoing problem

Find better ways to protect our health.

However this is the strangest flu so far it has the possibilities to become a global killer are it can fizz out but from what I have seen and can not type here I believe we are in for a wild ride I have provide links at the bottom of the page to guide and help you to prepare for the worst. Stock up on food and protect family

Here are the links and good luck I do wish this paper could have been better keep checking I will post more papers when I have the time.
